In addition, there is no standard for image collection, so bot automation is not standardized and is generally limited to the document formats most commonly used within a given center (eg, Word, PowerPoint, Excel, or TIFF) . On the other hand, some bot automation efforts have been undertaken in which bots are used to build the documents from the first place. This includes the development of a first bot that automates the creation of standard templates for use by other bots. In addition, some bots can create a standardized set of sample images to train and improve the performance of downstream bots .

R[esearch]{.smallcaps} {#sec1-4} ===== The use of artificial intelligence (AI) in business has seen an explosive growth. The use of AI for the development of document templates in document creation, for example, would minimize the time and effort of the document creator. In addition, it can be used to train a document creator to create a better understanding of the capabilities of AI. The adoption of AI can be viewed in two ways. In the first case, a set of AI rules can be developed to create documents with specified features. A set of business documents, for example, are converted to the required format. AI rules can be used to create the file structure and content. Then, AI rules can also be used to generate the document to be shared with the outside world. In the second case, AI can be used as a tool for a given document creator. AI can be used as an aid in annotating a sample and/or specifying the intended outputs of a given set of documents. A set of document templates can be created using AI and then AI can be used to convert the templates to a set of standard documents. T[raining]{.smallcaps} {#sec1-5} In the business document creation domain, AI can be used as a tool to improve the document creation skills of the document creator. In this case, the document creator can receive training on a set of documents. The document creator can then create a sample set of documents, using the given templates, to train the AI to build the documents. Once trained, AI can then be used to create the final document from the original template. For the example given above, a set of samples can be created, where the document creator can specify the intended content and features of the document. Then, the AI can be used to build
